TITLE OF THE INVENTION

SUBSTITUTED PHTHALAZINONES AS NEUROTENSIN  
ANTAGONISTS

INTRODUCTION OF THE INVENTION

This invention relates to novel substituted phthalazinone compounds represented by formula I:

which are antagonists of peptide hormone neurotensin. The invention is also concerned with the use of aforementioned neurotensin antagonists in the treatment of states mediated by neurotensin.

- 2 -

### BACKGROUND OF THE INVENTION

Neurotensin (NT) is a tridecapeptide hormone (pGlu-Leu-Tyr-Glu-Asn-Lys-Pro-Arg-Arg-Pro-Tyr-Ile-Leu-OH), originally isolated from the bovine hypothalamus [Carraway, R. and Leeman, S. E., J. Biol. Chem., **248**, 6854 (1973)], has subsequently been shown to be distributed in the brain [Uhl, G. R., et al., Proc. Natl. Acad. Sci. USA, **74**, 4059-4063 (1977)], gastrointestinal tract [1]. Kitabgi, P., Carraway, R. and Leeman, S. E., J. Biol. Chem., **251**, 7053 (1976); 2). Carraway, R., Kitabgi, P., and Leeman, S. E., J. Biol. Chem., **253**, 7996 (1978); 3). Helmstadler, V., Taugner, C., Feurle, G. E. and Frossman, W. G., Histochemistry, **53**, 35-41 (1977) and pancreas [Feurle, G. E. and Niestroj, S., Pancreas, **6**, 202-207 (1991) and references cited therein] of various animals including human [Mai, J. K., et al., Neuroscience, **22**, 499-524 (1987)]. Although the physiological role of neurotensin has not yet been clearly understood, this endogenous peptide participates in a wide spectrum of central [1]. Prange, A. J. and Nemeroff, C. B., Annal. NY Acad. Sciences, **400**, 368-375 (1982); 2). Stowe, Z. N. and Nemeroff, C. B., Life Sci., **49**, 987-1002, (1991); 3) Kitabgi, P., Neurochem. Int., **14**, 111-119 (1989); 4). Levant and Nemeroff, C. B., Current topics in Neuroendocrinology, **8**, 231-262 (1988)] and peripheral [Leeman, S. E., Aronin, N. and Ferris, C., Hormone Res., **38**, 93-132 (1982)] biological functions.

Neurotensin is also known to release mast cell histamine, indicating that antagonists will be useful in the treatment of allergic and inflammatory conditions, as well. [See, Rossei, S.S. and Miller, R.J., Life Sci., **31**, 509-516 (1982) and Kurose, M. and Saeki, K., Eur. J. Pharmacol., **76**, 129-136 (1981).]

Neurotensin, like most other peptides, is unable to cross the blood-brain barrier (BBB). However, certain peripheral effects of neurotensin have been observed after central administration of the peptide [Prange, A. J. and Nemeroff, C. B., Annal. NY Acad. Sciences, **400**, 368-391 (1982)]. The direct application of neurotensin into the brain causes hypothermia, potentiation of barbiturate induced sedation, catalepsy, antinociception, blockade of psychostimulant-induced

- 3 -

locomotor activity and reduced food consumption. In the central nervous system (CNS), neuropeptides behave as a neurotransmitter or neuromodulator [1] Uhl, G. R. and Snyder, S. H., Eur. J. Pharmacol., 41, 89-91 (1977); 2) Uhl, G. R., Annal. NY Acad. Sciences, 400, 132-149 (1982)], and has been shown to have close anatomical and

5 biochemical associations with the dopaminergic (DA) system [Nemeroff, C. B., et al. Annal. NY Acad. Sciences, 400, 330-344 (1982)].

Neuropeptides increase the synthesis and the turnover of DA in rat brain. Acute and chronic treatment with clinically efficacious antipsychotic drugs (e.g., haloperidol, chlorpromazine) have consistently

10 demonstrated an increase in neuropeptide concentrations in the nucleus accumbens and striatum while phenothiazines that are not antipsychotics did not produce this increase. Behaviorally, neuropeptides, after central administration, mimics the effects of systemically administered neuroleptics. However, unlike classical neuroleptics (which primarily acts on D<sub>2</sub> receptors), neuropeptides fails to bind to dopamine receptors or inhibit cAMP accumulation following DA receptor activation.

15 Neuropeptides does not block the stereotypy induced by DA agonists. The post-mortem studies of patients with schizophrenia showed an increase in the level of neuropeptides in the Brodmann's area 32 of human brain [Nemeroff, C. B., et. al., Science, 221, 972-975 (1983) and references cited therein], which suggest possible roles of neuropeptides in the pathophysiology of this disease. Neuropeptide receptors have also been implicated in Parkinson's disease and progressive supranuclear palsy [Chinaglia, G. et al., Neuroscience, 39, 351-360 (1990)].

20 25 Of the total body neuropeptides in many mammalian species, more than 80% is present in the gastrointestinal tract, especially in the distal small intestine in the endocrine like N-cells. In the gut, neuropeptides stimulates pancreatic secretion [Sakamoto, T., et al., Surgery, 96, 146-153 (1984)], inhibits gastric acid secretion and gastric emptying [Blackburn, A. M., Lancet, 1, 987-989 (1980)]. Neuropeptides also stimulates the growth of small intestinal mucosa in an isolated defunctional loop of jejunum, which suggests a direct systemic effect of neuropeptides in the gut. In addition, neuropeptides can stimulate pancreatic

- 4 -

exocrine secretion in mammals [Iwatsuki, K., et al., Clin. Expt. Pharmacol. Physiol., **18**, 475-481 (1991) and references cited therein].

From the structural work, it is evident that the biological activity of neuropeptides resides within the carboxy terminal five or six amino acid residues. The C-terminal hexapeptide NT<sup>8-13</sup> has displayed full biological activity of the tridecapeptide. In contrast, all amino terminal partial sequences are essentially inactive [Leeman, S. E. and Carraway, R. E., Annal. NY Acad. Sciences, **400**, 1-16 (1982)]. The C-terminal COOH group and two Arg residues are essential for the biological activity of NT<sup>8-13</sup> as well as neuropeptides. L-amino acids are required at positions-9,10,11 and 13, and only Arg<sup>8</sup> can be replaced by D-Arg without loss of any activity. At the position-11, an aromatic amino acid is essential. Similarly, alkyl side-chains of Ile<sup>12</sup> and Leu<sup>13</sup> are also necessary for full biological activity [Kitabgi, P., Annal. NY Acad. Sciences, **400**, 37-53 (1982)]. Most of the analogues of neuropeptides examined generally behaved as agonists. However, two analogues D-Trp<sup>11</sup>-NT and Tyr(Me)<sup>11</sup>-NT have displayed partial antagonist activity [Riou, F. R., et al., Eur. J. Pharmacol., **66**, 373-379 (1980)].

Although there are reports of peptidic neuropeptides antagonists, none are clinically useful, due to their short biological half life and limited oral bioavailability.

A European Patent Application, EP 477,049, disclosing 3-carboxamido-1,2-pyrazoles as non-peptidic neuropeptides antagonists recently published.

The terms "alkyl", "alkenyl", "alkynyl": and the like include both the straight chain and branched chain species of these generic terms wherein the number of carbon atoms in the species permit. Unless otherwise noted, the specific names for these generic 15 terms shall mean the straight chain species. For example, the term "butyl" shall mean the normal butyl substituent, *n*-butyl.

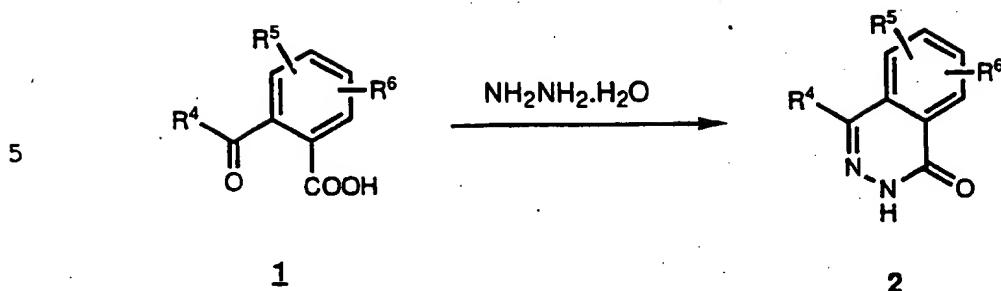

For a general review of synthesis and reactivity of substituted phthalazinones and related compounds, see - M. Tishler and B. Stanovnik, Comprehensive Heterocyclic Chemistry, Vol. 3 (part 2B), 20 1-56 (1984) Eds: A. J. Boulton and A. McKillop; Pergamon Press., and also N. R. Patel, Heterocyclic Compounds, Vol. 27, Chapter II, pages 376-446 (1973). Ed: R. N Castle, John Wiley & Sons, and references cited therein.

Scheme 1 illustrates the preferred method for the 25 preparation of substituted phthalazin-1-(2H)-ones. An appropriately substituted 2-acylbenzoic acid 1 or a similar starting material is reacted with hydrazine hydrate in an appropriate solvent such as an alcohol or acetic acid under reflux for 2-24 h to form the corresponding substituted phthalazin-1-(2H)-one 2.

30

- 19 -

### Scheme 1

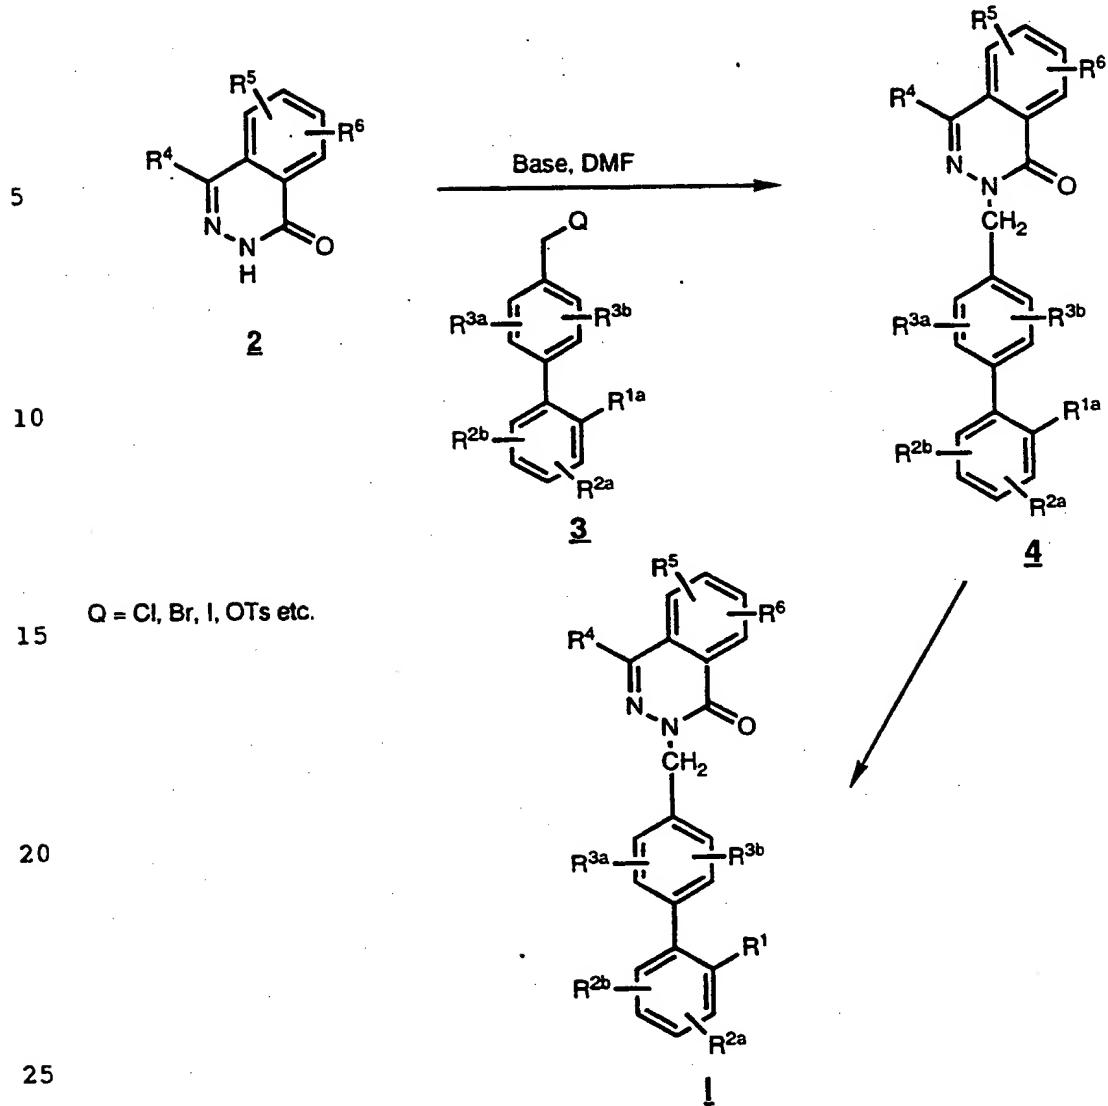

Where R<sup>4</sup> is H, alkyl or aryl, as defined before.

The keto acid 1 may be prepared from the appropriately substituted 2-bromobenzoic acid or a similar starting material using the methods described in the literature [W. E. Parham, C. K. Bradsher, K. J. Edger, J. Org. Chem., **46**(6), 1057(1981) and references cited therein]. Alternatively, the keto acids may also be synthesized by procedures described by R. L. Shriner et al., J. Org. Chem., **16**, 1064 (1951), and C. R. Hauser et al., J. Org. Chem., **23**, 861 (1958).

A general method for the preparation of 2-alkyl-phthalazin-1-(2H)-ones of Formula I is illustrated in Scheme 2. An appropriately substituted phthalazin-1-(2H)-one 2 is alkylated with the appropriate alkyl halide 3 (or pseudo halide, such as tosylate, mesylate, triflate and the like) in the presence of an appropriate base such as alkali metal hydrides, carbonates, bicarbonates or an organic base (e.g., trialkylamines, morpholine and the like) in an appropriate polar solvent, such as dimethylformamide, dimethylsulfoxide, tetrahydrofuran, lower alkyl alcohols and the like. The alkylated material 4 may then be transformed into the desired compound of Formula I by removal of the protecting group present in R<sup>1a</sup> followed by further transformation of the functional group, thus formed, into the desired R<sup>1</sup> group. Similarly, the R<sup>1a</sup> may also be directly transformed into the desired R<sup>1</sup> to give the compound of formula I.

- 20 -

Scheme 2

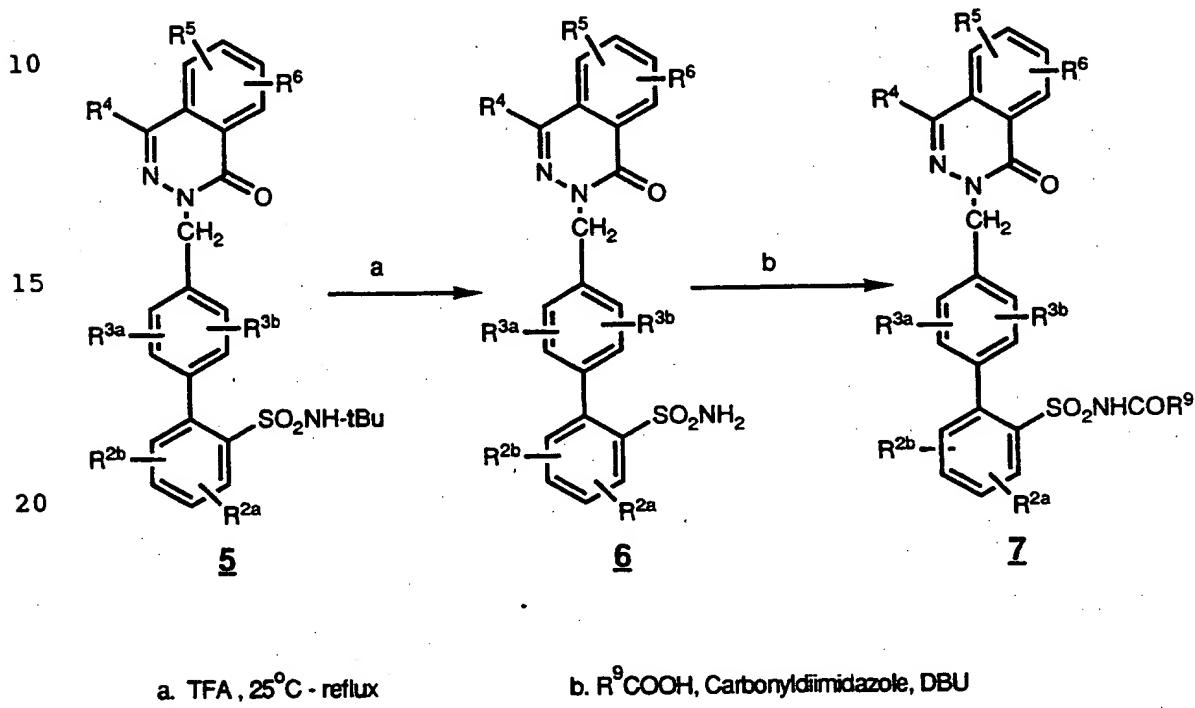

The biphenyl alkylating agents **3** can be synthesized using the reactions and techniques described in published US Patent No. 30 5,126,342 (Merck & Co, Inc.).

- 21 -

Compounds of Formula I in which R<sup>1</sup> is SO<sub>2</sub>NHR<sup>9</sup> or SO<sub>2</sub>NHCOR<sup>9</sup> may be prepared according to the general methods described for such transformations in US Patent 5,126,342. More specifically these compounds may be prepared as outlined in Scheme 3.

5

### Scheme-3

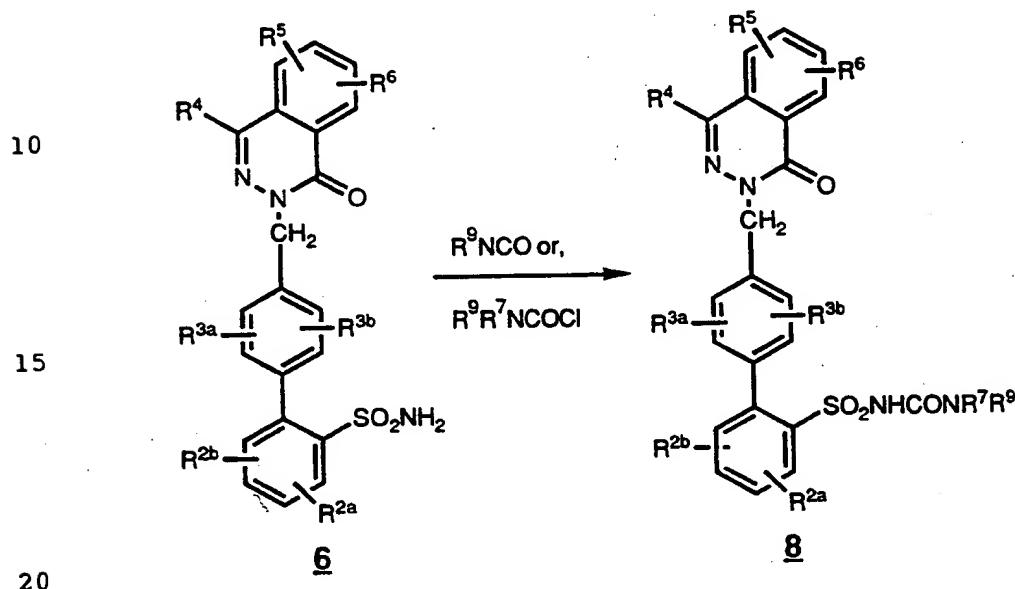

The protected sulfonamide 5 (prepared as described in Scheme 2 using the alkylating agent 3, where R<sup>1a</sup> is -SO<sub>2</sub>NH-tBu) is reacted with TFA, and the resulting free sulfonamide 6 is acylated with an appropriate acylimidazole (generated from the corresponding R<sup>9</sup>COOH and carbonyldiimidazole) in the presence of DBU to form the acylsulfonamide 7.

- 22 -

Compounds of Formula I in which R<sup>1</sup> is SO<sub>2</sub>NHCOOR<sup>9</sup> or SO<sub>2</sub>NHCONR<sup>7</sup>R<sup>9</sup> may be prepared according to methods outlined in Schemes 4 and 5.

5

Scheme-4

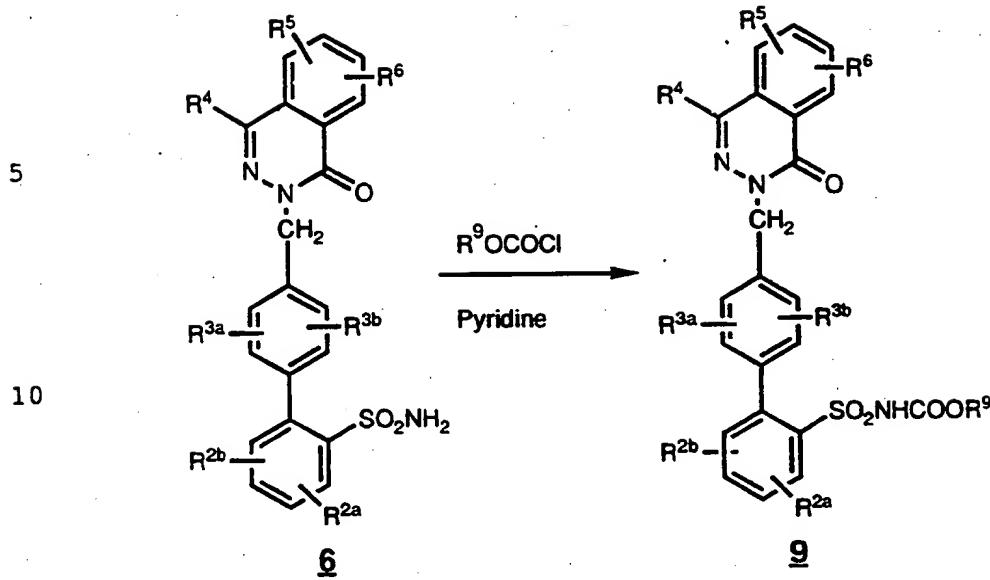

20

The sulfonamide 6 may be reacted with an appropriate  
25 isocyanate (R<sup>9</sup>NCO) or carbamoyl chloride (R<sup>7</sup>R<sup>9</sup>NCOCl) in the presence of an appropriate base to form the corresponding sulfonylureas 8.

30

- 23 -

Scheme-5

15

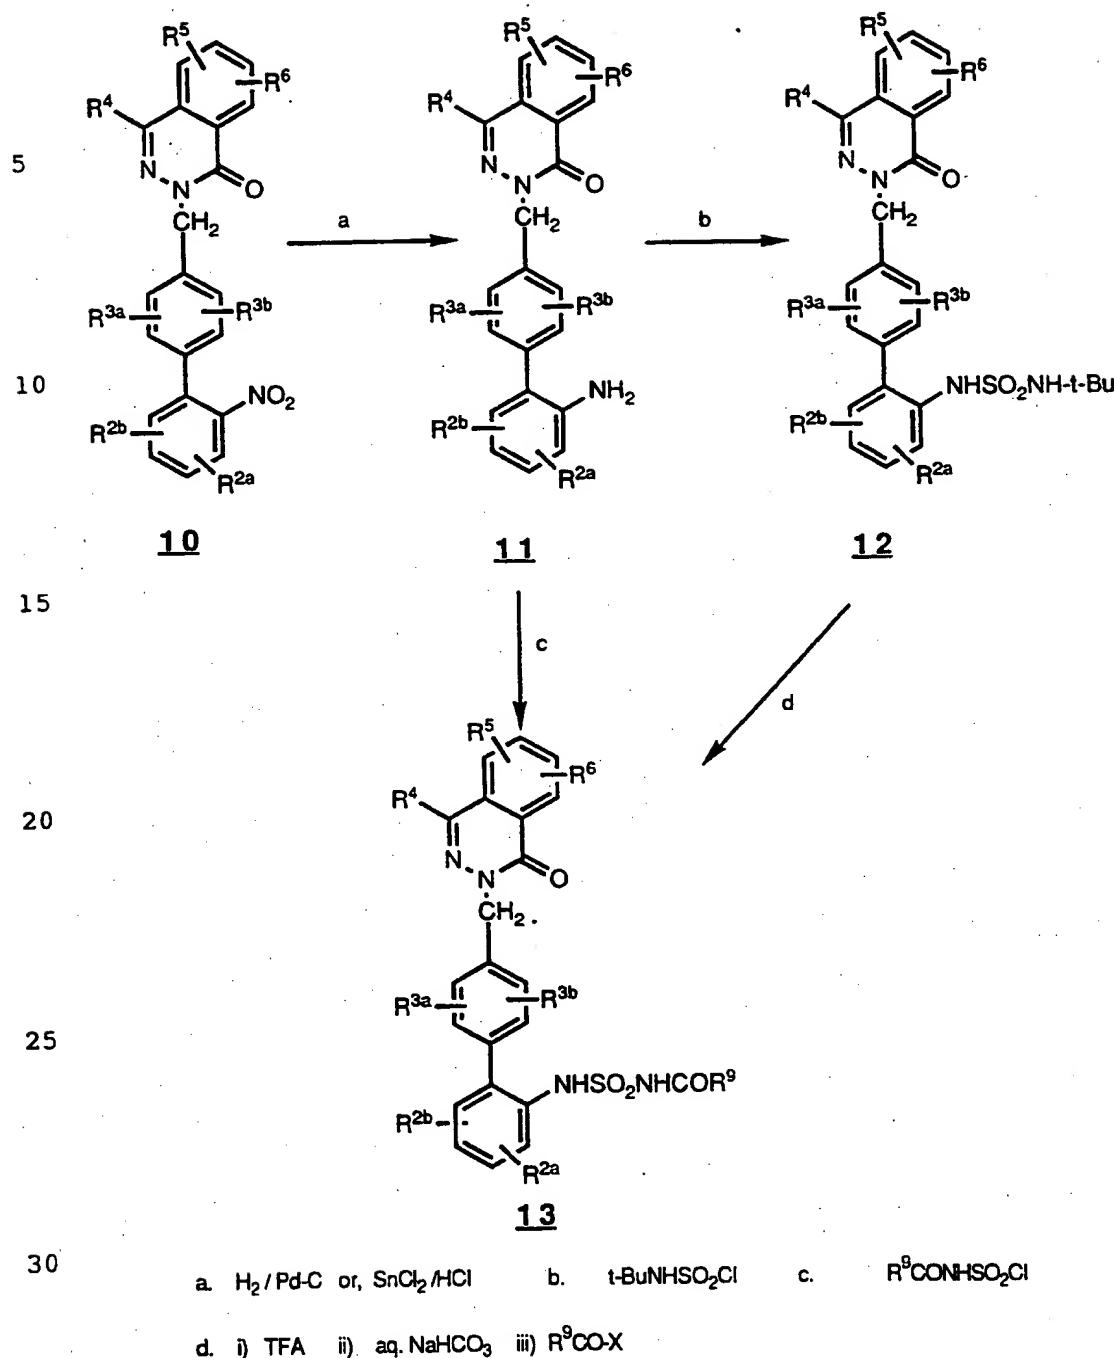

Similarly, the sulfonamide **6** may be reacted with an appropriate alkyl or aryl chloroformate ( $R^9OCOCl$ ) in the presence of an appropriate base such as pyridine to form the corresponding sulfonylcarbamate **9**.

Compounds of Formula I, where  $R^1$  is  $-\text{NSO}_2\text{NHCOR}^9$  may be prepared from the corresponding nitro precursor **10** (prepared according to Scheme 2, where  $R^{1a} = \text{NO}_2$ ) as outlined in Scheme 6. The nitro group in **10** is reduced to the corresponding amine **11** which may then be reacted with t-butylsulfamoyl chloride to give the N-t-butylsulfamide **12**. Removal of the t-butyl group followed by acylation may produce the desired acylsulfamides **13**. Similarly, compound **12** may be reacted with an appropriate N-acylsulfamoyl chloride to give **13**.

30

Scheme 6

- 25 -

The reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformation being effected. It is understood by those skilled in the art of organic synthesis that the functionality present on the heterocycle and in the reactants being employed should be consistent with the chemical transformations being conducted. Depending upon the reactions and techniques employed, optimal yields may require changing the order of synthetic steps or use of protecting groups followed by deprotection.

The compounds of this invention form salts with various inorganic and organic acids and bases which are also within the scope of the invention. Such salts include ammonium salts, alkali metal salts like sodium and potassium salts, alkaline earth metal salts like the calcium and magnesium salts, salts with organic bases; e.g., dicyclohexylamine salts, N-methyl-D-glutamine salts, salts with amino acids like arginine, lysine, and the like. Also, salts with organic and inorganic acids may be prepared; e.g., HCl, HBr, H<sub>2</sub>SO<sub>4</sub>, H<sub>3</sub>PO<sub>4</sub>, methanesulfonic, toluenesulfonic, maleic, fumaric, camphorsulfonic. The nontoxic, physiologically, acceptable salts are preferred, although other salts are also useful in isolating and/or purifying the product.

The salts can be formed by conventional means, such as by

reacting the free acid or free base forms of the product with one or more equivalents of the appropriate base or acid in a solvent or medium in which the salt is insoluble, or in a solvent such as water which is then removed in vacuo or by freeze-drying or by exchanging the cations of an existing salt for another cation on a suitable ion exchange resin.

Neurotensin is a peptide hormone and the assays described below have been developed to identify neurotensin antagonists and to determine their efficacy in vitro. The following three assays have been employed for that purpose.

### RAT FOREBRAIN RECEPTOR ASSAY

Male rats are sacrificed by decapitation following ether anesthetization. Forebrains are homogenized using a polytron in 20 volumes 50 mM Tris HCl, pH 7.4, and centrifuged at 50,000 x g for 20 min. The final pellet is washed twice by rehomogenization and centrifugation as before. The final pellet is resuspended at a concentration of 8 mg tissue (wet weight) per 0.750 ml of 50 mM Tris HCl, pH 7.4, which also contains 1 mM EDTA, 4 mg/ml bacitracin, 5 mM levocabastine HCl, 1mM phenanthroline, 10 mg/ml soybean trypsin inhibitor and 100 mM phenyl methyl sulfonyl fluoride. Assay tubes (13 X 100 mm polypropylene) receive 1) 100 µl buffer or 10 mM neurotensin (for non-specific binding) 2) 100 µl of 60 pM [<sup>125</sup>I]neurotensin 3) 20 µl test compounds 4) 750 µl tissue suspension and 5) enough buffer to bring final volume to 1 ml. After 30 minutes at room temp, the samples are filtered using a Brandel M24 cell harvester with GF/B filtermats that have been presoaked in 0.2% polyethyleneimine for 2 hours. The tubes are rinsed with 3 X 4 ml of ice cold 10 mM Tris buffer (pH 7.4 at room temperature). The filter discs are placed in 12 X 75 mm polypropylene tubes for counting on a Packard Multi-Prias gamma counter.

### HUMAN HT-29 CELL MEMBRANE ASSAY

HT-29 cells were routinely grown in 225 cm<sup>2</sup> Costar tissue culture flasks at 37°C in a humidified atmosphere of 5% CO<sub>2</sub>/95% air in Dulbecco's modified Eagle's medium with high glucose containing 50 U/ml penicillin, 50 mg/ml streptomycin, 5% fetal bovine serum and 5% newborn calf serum. Cells were subcultured with 0.25% trypsin at a ratio of 1:6 with confluence being reached at 48 to 72 hrs. Cells from confluent flasks (approx. 1 x 10<sup>8</sup> cells/flask) were harvested by scraping. The cells were pelleted by centrifugation (1000 x g, 5 min), resuspended in 50 mM Tris HCl, pH 7.4, and homogenized with a polytron (setting 7 for 10 sec.). Cell membranes were washed twice by centrifugation (50,000 x g, 15 min) and rehomogenized. The resulting pellet was either frozen at -70°C for future use or run directly in the

assay by resuspending at a concentration of  $0.5 \times 10^6$  cells per 0.750 ml of assay buffer (50 mM Tris HCl, pH 7.4, containing 1 mM EDTA, 40 mg/ml bacitracin, 1 mM phenanthroline, 10 mg/ml soybean trypsin inhibitor and 100 mM phenylmethylsulfonyl fluoride).

5 Assay tubes (13 x 100 mm polypropylene) receive 1) 100  $\mu$ l buffer or 10 mM neurotensin (for non-specific binding) 2) 100  $\mu$ l of 60 pM [ $^{125}$ I]neurotensin 3) 20  $\mu$ l test compounds 4) 750  $\mu$ l cell membrane suspension and 5) enough buffer to bring final volume to 1 ml. After 30 minutes at room temperature, the samples are filtered  
10 using a Brandel M24 cell harvester with GF/B filtermats that have been presoaked in 0.2% polyethyleneimine for 2 hours. The tubes are rinsed with 3 x 4 ml of ice cold 10 mM Tris buffer (pH 7.4 at room temperature). The filter discs are placed in 12 x 75 mm polypropylene tubes for counting on a Packard Multi-Prias gamma counter. [The  
15 above assay is derived from the assay described in Kitabgi, P. et al., Molecular Pharmacology, 18, 11-19 (1980)].

#### NEUROTENSIN BINDING ASSAY TO HUMAN FRONTAL CORTEX

20 Post-mortem human brain is obtained through the National Disease Research Interchange (Philadelphia, PA). The donors were without psychiatric or neurological abnormalities. Frontal cortex is dissected free of white matter and homogenized using a polytron in 20 volumes 50 mM Tris HC1, pH 7.4, and centrifuged at 50,000 x g for 20 min. The resulting pellet is washed twice by rehomogenization and  
25 centrifugation as before. The final pellet is resuspended at a concentration of 8 mg tissue (wet weight) per 0.750 ml of 50 mM Tris HC1, pH 7.4, which also contains 1 mM EDTA, 4 mg/ml bacitracin, 1 mM phenanthroline, 10 mg/ml soybean trypsin inhibitor and 100 mM phenyl methyl sulfonyl fluoride. Assay tubes (13 x 100 mm  
30 polypropylene) receive 1) 100  $\mu$ l buffer or 10 mM neurotensin (for non-specific binding) 2) 100  $\mu$ l of 60 pM [ $^{125}$ I]neurotensin 3) 20  $\mu$ l test compounds 4) 750  $\mu$ l tissue suspension and 5) enough buffer to bring final volume to 1 ml. After 30 minutes at room temp, the samples are filtered using a Brandel M24 cell harvester with GF/B

filtermats that have been presoaked in 0.2% polyethyleneimine for 2 hours. The tubes are rinsed with 3 x 4 ml of ice cold 10mM Tris buffer (pH 7.4 at room temperature). The filter discs are placed in 12 x 75 mm polypropylene tubes for counting on a Packard Multi-Prius gamma counter.

5. Using the methodology described above, representative compounds of the invention were evaluated and all were found to exhibit an activity of at least IC<sub>50</sub><50μM thereby demonstrating and confirming the utility of the compounds of the invention as effective neurotensin antagonists.
10. Thus, the compounds of the present invention are useful in attenuating the effect of peptide hormone neurotensin, and hence in the treatment of conditions that are caused by altered levels of neurotensin in humans. These compounds are of value in the treatment of a variety of central nervous system disorders, such as psychoses, depression, Alzheimer's disease and anxiety. These compounds may also be expected to be useful in the treatment of gastrointestinal disorders such as gastroesophageal reflux disorder (GERD), irritable bowel syndrome, diarrhea, cholic, ulcer, GI tumors, dyspepsia, pancreatitis and esophagitis.
15. About 1 to 100 mg. of compound or mixture of compounds of Formula I or a physiologically acceptable salt is compounded with a physiologically acceptable vehicle, carrier, excipient, binder, preservative, stabilizer, flavor, etc., in a unit dosage form as called for by accepted pharmaceutical practice. The amount of active substance in these compositions or preparations is such that a suitable dosage in the range indicated is obtained.
20. Illustrative of the adjuvants which can be incorporated in tablets, capsules and the like are the following: a binder such as gum tragacanth, acacia, corn starch or gelatin; an excipient such as microcrystalline cellulose; a disintegrating agent such as corn starch, pregelatinized starch, alginic acid and the like; a lubricant such as magnesium stearate; a sweetening agent such as sucrose, lactose or saccharin; a flavoring agent such as peppermint, oil of wintergreen or cherry. When the unit dosage unitform is a capsule, it may contain, in

- 29 -

addition to materials of the above type, a liquid carrier such as fatty oil. Various other materials may be present as coatings or to otherwise modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain the active compound, sucrose as a sweetening agent, methyl and propyl parabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

Sterile compositions for injection can be formulated according to conventional pharmaceutical practice by dissolving or suspending the active substance in a vehicle such as water for injection, a naturally occurring vegetable oil like sesame oil, coconut oil, peanut oil, cottonseed oil, etc., or a synthetic fatty vehicle like ethyl oleate or the like. Buffers, preservatives, antioxidants and the like can be incorporated as required.

The following examples illustrate the preparation of the compounds of formula (I) and their incorporation into pharmaceutical compositions and as such are not to be considered as limiting the invention set forth in the claims appended hereto.

All  $^1\text{H-NMR}$  spectra were recorded on a Varian XL-200 or XL-400 Fourier Transform spectrometer. Chemical shifts are reported as (parts per million) downfield from tetramethylsilane. Mass spectra were obtained from the Merck & Co, Inc. mass spectral facility in Rahway, N.J.. Analytical TLC was conducted on E. M. Merck precoated silica plates (0.25 mm on glass, Kieselgel 60 F254) with UV and/or iodine visualization. Flash chromatography was conducted using E. Merck silica gel (mesh 200-400). All reactions were carried out under an atmosphere of dry nitrogen under standard conditions unless specified otherwise.

SYNTHESIS OF PHTHALAZIN-1(2H)-ONES: (A GENERAL DESCRIPTION):

---

- 5 To a suspension or a solution of an appropriate 2-acylbenzoic acid (available from a commercial source or prepared according to the literature procedure cited earlier)(1 mMol) in ethanol (5 ml) was added hydrazine hydrate (5 mMol), and the resulting mixture was refluxed for 2-6 h. The reaction was cooled to room
- 10 temperature, and the solid precipitated was filtered, washed with water and then cold ethanol. The resulting solid was dried in vacuo to give the desired phthalazin-1-(2H)-one which was crystallized from ethanol or any other appropriate solvent. Alternatively, the reaction mixture was concentrated to give the crude product which was then purified by
- 15 trituration with water followed by crystallization from an appropriate solvent to give the desired phthalazin-1-(2H)-one.

## EXAMPLE 2

### Preparation of 4-p-tolyl-2-(2'-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

5      Step 1.    4-p-tolyl-2-(2'-t-butylaminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one (Alkylation of substituted phthalazin-1-(2H)-one)

To a suspension of 4-p-tolyl-phthalazin-1-(2H)-one [compound 2D] (2.36 g, 10 mMol) in toluene (50 mL) were added 2.5  
10 N aqueous NaOH (4 mL) and Triton B (1 mL) followed by 2-(4'-bromomethylbiphenyl)-t-butylsulfonamide [prepared according to the procedure described in US patent 5126342] (4.2 g, 11 mMol). The mixture was stirred at 85°C for 12 h and then cooled to room  
15 temperature. The reaction was diluted with ethylacetate (100 mL), and the organic phase was washed with water (3 X 50 mL), and then dried over MgSO<sub>4</sub>. The ethylacetate layer was filtered and concentrated in vacuo to a small volume (~10 mL). Dry ether (100 mL) was added and the precipitate formed was filtered and dried. The crude product was then recrystallized from hot ethylacetate to give the desired product 4-p-tolyl-2-(2'-t-butylaminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one as white crystalline solid (4.3 g).

20      <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 8.49 (m, 1H), 8.15 (d, 1H), 7.76 (m, 3H), 7.15-7.60 (m, 11 H), 5.50 (s, 2H), 3.51 (s, 1H), 2.45 (s, 3H), 0.91 (s, 9H).  
FAB-MS: (m/e) 538 (M+H).

25      Step 2.    4-p-tolyl-2-(2'-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one (Removal of the t-butyl group):  
A solution of 4-p-tolyl)-2-(2'-t-butylaminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one (2.7 g, 5.02 mMol) in trifluoroacetic acid (20 mL) was stirred at room temperature for 12-15 h. The solvent was removed in vacuo, and the residue was treated with cold aqueous saturated NaHCO<sub>3</sub>. The precipitate formed was filtered and washed with water and then dried. The solid (2.4 g) was triturated with 50% ether in ethyl acetate (20 mL) at room temperature and

- 33 -

filtered to give the desired sulfonamide 4-p-tolyl-2-(2'-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one as white amorphous solid (2.2 g).

### EXAMPLE 10

#### ACYLATION OF SULFONAMIDE

- 5      4-p-tolyl-2-(2'-(6-(N-t-butoxycarbonyl)amino hexanoyl)-aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

To a solution of 6-(N-t-butoxycarbonyl)amino hexanoic acid (2.88 g, 12.45 mMol) in dry tetrahydrofuran (THF) (25 mL) was added carbonyl diimidazole (2.1 g, 12.45 mMol). The mixture was heated at 65°C for 3 h. After cooling to room temperature, a solution of the sulfonamide 4-p-tolyl-2-(2'-(6-(N-t-butoxycarbonyl)amino hexanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one (obtained in Example 2) (2.0 g, 4.15 mMol) and 1,8-diazabicyclo-[5.4.0]undec-7-ene (DBU) (1.86 mL, 12.45 mMol) in THF (20 mL) was added. The solution was stirred at 50°C for 18 hr. then concentrated to dryness *in vacuo*. 5% Citric acid solution was added and the mixture extracted with ethyl acetate three times. The combined organic phase was washed with brine, dried (over magnesium sulfate) and the solvent removed *in vacuo*. The residue was pre-absorbed on silica gel and purified by flash chromatography using chloroform-methanol-NH<sub>4</sub>OH (150:10:1) to give the titled acyl sulfonamide as a white amorphous solid, which was recrystallized from diethyl ether/hexane (2.3 g).

1H-NMR (CDCl<sub>3</sub>): δ 8.50 (m, 1H), 8.22 (d, 1H), 7.78 (m, 3H), 7.15-7.60 (m, 11 H), 5.52 (s, 2H), 3.0 (m, 2H), 2.45 (s, 3H), 1.84 (t, 2H), 1.44 (s, 9H), 1.1-1.4 (m, 6H).

EXAMPLE 20

4-p-tolyl-2-(2'-(6-(N,N-dimethylamino)hexanoyl)aminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one.

5       The amine (from Example 15) (10 mg, 0.017 mmol), 30% formaldehyde solution (1 mL) and formic acid (0.4 mL) were heated together at 100 °C for 2 hr. The mixture was concentrated to dryness *in vacuo*. The residue was pre-absorbed on silica gel and chromatographed (0 - 10% methanol/methylene chloride, 1% ammonia) to give the titled  
10      dimethylamine compound (5.9 mg, 56%) (for spectral data see Table VI).

EXAMPLE 21

15      4-p-tolyl-2-(2'-(4-(N-t-butoxycarboxamido)butanoyl) aminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one.

Carbonyl diimidazole (49 mg, 0.3 mmol) was added to a solution of t-BOC-aminobutyric acid (61 mg, 0.3 mmol) in tetrahydrofuran (THF) (3 mL) under nitrogen at room temperature.

20      The mixture was heated at 65 °C for 3 hr. After cooling to room temperature, a solution of the sulfonamide (obtained in Example 2) (48 mg, 0.1 mmol) and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) (37 µL, 0.25 mmol) in THF (3 mL) was added. The solution was heated at 50 °C for 18 hr. then concentrated to dryness *in vacuo*. 5% Citric acid  
25      solution was added and the mixture extracted with ethyl acetate three times. The combined organic phase was washed with brine, dried (magnesium sulfate) and the solvent removed *in vacuo*. The residue was pre-absorbed on silica gel and chromatographed (0 - 10% methanol/methylene chloride) to give the titled acyl sulfonamide which  
30      was recrystallized from diethyl ether/hexane (32 mg, 48%) (for spectral data see Table VI).

### EXAMPLE 24

4-p-tolyl-2-(2'-(5-carboxy-pentanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

25 2M Lithium hydroxide solution (0.9 mL) was added to a stirred solution of the ethyl ester (Example 23) (300 mg, 0.47 mmol) in THF (15 mL) and water (3 mL) at room temperature. After stirring for 3 hr., 2M lithium hydroxide solution (0.9 mL) was added and stirring 30 continued for 18 hr. The solution was concentrated *in vacuo*. 5% Citric acid was added and the mixture extracted with chloroform three times. The combined organic phase was washed with brine, dried (magnesium sulfate) and the solvent removed *in vacuo* to give the titled carboxylic acid (245 mg, 86%) (for spectral data see Table VII).

### EXAMPLE 25

4-p-tolyl-2-(2'-(5-(N-morpholinocarbonyl)pentanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

5 Carbonyl diimidazole (32 mg, 0.2 mmol) was added to a stirred solution of the carboxylic acid (Example 24) (40 mg, 0.066 mmol) in THF (3 mL) under nitrogen at room temperature. The solution was heated at 65 °C for 3 hr. After cooling to room temperature, morpholine (9 µL, 0.1 mmol) was added and the mixture heated at 50 °C for 18 hr. The solution was concentrated to dryness *in vacuo*. 5% Citric acid solution was added and the mixture extracted with ethyl acetate three times. The combined organic phase was washed with brine, dried (magnesium sulfate) and the solvent removed *in vacuo*. The residue was pre-absorbed on silica gel and chromatographed (0 - 5% methanol/methylene chloride) to give the titled morpholino amide compound (15 mg, 33%) (for spectral data see Table VII).

### EXAMPLE 26

20 4-p-tolyl-2-(2'-(5-(N,N-dimethylcarboxamido)pentanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

The titled dimethyl amide was synthesized from the carboxylic acid (Example 24) and dimethylamine using the procedure outlined for Example 25. Chromatography (0 - 3% methanol/methylene chloride) afforded the dimethyl amide (15.5 mg, 37%) (for spectral data see Table VII).

### EXAMPLE 27

30 4-p-tolyl-2-(2'-(6-(N-acetamido)hexanoyl)aminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one.

Acetic anhydride (0.5 mL) followed by dimethylamino-pyridine (3 mg) was added to the amine hydrochloride (obtained from Example 15) (30 mg, 0.048 mmol) under nitrogen at room

- 40 -

temperature. The solution was stirred at room temperature for 18 hr. then water added. The solid which precipitated was isolated by filtration and dried *in vacuo*. Recrystallization (ethyl acetate/diethyl ether) gave the titled acetamide (14.5 mg, 48%) (for spectral data see Table VII).

The volatile components of the mixture were removed *in vacuo* and the residue recrystallized (ethyl acetate/diethyl ether) to give the titled  
10 amine as the hydrochloride salt (38 mg, 74%) (for spectral data see Table VIII).

### EXAMPLE 31

15 4-p-tolyl-2-(2'-(4-(N,N-dimethylcarbamoyl)butanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

DBU (28  $\mu$ L, 0.25 mmol) was added to the amine hydrochloride (Example 30) (45 mg, 0.07 mmol) in THF (1.5 mL) under nitrogen at 0 °C. Dimethylcarbamyl chloride (10  $\mu$ L, 0.11 mmol)  
20 was added and stirring continued at 0 °C for 5 hr. The solution was concentrated *in vacuo* then 5% citric acid solution added. The mixture was extracted with ethyl acetate four times. The combined organic phase was washed with brine, dried (magnesium sulfate) and the solvent removed *in vacuo*. The residue was pre-absorbed on silica gel and  
25 chromatographed (0 - 10% methanol/ methylene chloride) to give the titled dimethyl urea (16 mg, 36%) (for spectral data see Table VIII).

### EXAMPLE 32

30 4-p-tolyl-2-(2'-(5-(N-pyrrolidinocarbonyl)pentanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one.

The titled pyrrolidine amide was synthesized from the carboxylic acid (Example 24) and pyrrolidine using the procedure outlined for Example 25. The crude product was pre-absorbed on silica

- 42 -

gel and chromatographed (0 - 10% methanol/methylene chloride) to give the pyrrolidine amide (29 mg, 67%) (for spectral data see Table VIII).

4-p-tolyl-2-(2'-(hexylaminocarbonylaminosulfonyl)biphen-4-yl)methylphthalazin-1-(2H)-one

DBU (37  $\mu$ L, 0.25 mmol) was added to a stirred solution of  
5 the free sulfonamide (Example 2) (48 mg, 0.10 mmol) in THF (3 mL)  
under nitrogen at room temperature. After stirring for 0.5 hr. hexyl  
isocyanate (27  $\mu$ L, 0.25 mmol) was added and the mixture stirred for  
18 hr. The solvent was removed *in vacuo* then 5% citric acid solution  
10 added. The mixture was extracted with ethyl acetate three times. The  
combined organic phase was washed with brine, dried (magnesium  
sulfate) and the solvent removed *in vacuo*. The residue was pre-  
absorbed on silica gel and chromatographed (5% methanol/methylene  
chloride, 0.5% ammonia) to give the titled sulfonyl urea that was  
recrystallized from ethyl acetate/hexane (9.1 mg, 15%) (for spectral  
15 data see Table IX).

EXAMPLES 35 - 37

Examples 35-37 were prepared using the procedure  
20 outlined for Example 34 (See Table IX).

EXAMPLES 38 - 47

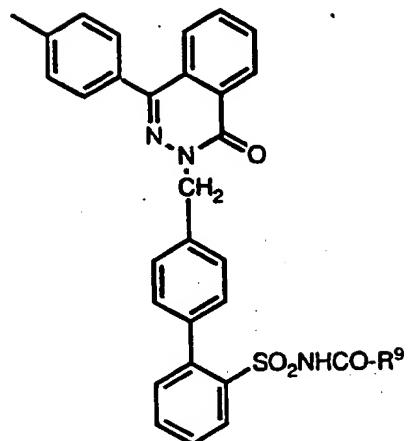

Examples 38-47 were prepared using appropriate  
25 procedures as outlined for Examples 1-33 (See Table IX).

EXAMPLE 48

Step 1: 4-(Morpholinomethyl)phenyl-2-[(2'-t-butylamino-sulfonyl)biphen-4-yl]methyl-phthalazin-1-(2H)-one.

A mixture of 4-p-tolyl-2-[(2'-t-butylaminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one (0.27 g, 0.5 mMol), N-bromo-succinimide (0.09 g, 0.5 mMol) and azaisobutyro-nitrile (AIBN) (0.01g) was refluxed for 3h and then cooled down to room temperature. The mixture was filtered and the filtrate concentrated *in vacuo* to give a foam (0.3g). The foam was dissolved in methylene chloride (5 mL) and cooled in an ice-bath. Morpholine (1 mL) was then added, and the mixture was stirred at room temperature for 15 h. The reaction mixture was concentrated *in vacuo* and the residue obtained was purified by flash chromatography [silica-gel using initially ethyl acetate-hexane (1:2) and then ethyl acetate-hexane (2:1)] to give the titled product as white solid (0.16g).

<sup>1</sup>H-NMR(CDCl<sub>3</sub>): δ 8.52 (m, 1H), 8.15 (d, 1H), 7.79 (m, 3H), 7.36-7.65 (m, 10 H), 7.23 (m, 1H), 5.52 (s, 2H), 3.75 (t, 4H), 3.60(s, 2H), 3.51 (s, 1H), 2.52 (t, 4H), 0.91 (s, 9H).

FAB-MS: (m/e) 609 (M+H).

Step 2: 4-(Morpholinomethyl)phenyl-2-[(2'-(6-(N-t-butyloxy carbonylamino)hexanoyl)aminosulfonyl)-biphen-4-yl]methyl-phthalazin-1-(2H)-one.

4-(Morpholinomethyl)phenyl-2-[(2'-aminosulfonyl)-biphen-4-yl)methyl-phthalazin-1-(2H)-one [prepared from 4-(Morpholinomethyl)phenyl-2-[(2'-t-butylaminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one according to the procedure described in Example 2; Step 2] (0.1g, 0.18 mMol) was reacted in THF (3 mL) with the acyl-imidazole [prepared from N-t-Boc-amino hexanoic acid (0.083 g, 0.36 mMol) and N,N-carbonyldiimidazole (0.06 g, 0.36 mMol)] and DBU (0.053 mL), according to the procedure described in Example 10. The titled compound was obtained as a foam (0.12g), after purification of the crude product by flash chromatography (silica-gel, chloroform-methanol-NH<sub>4</sub>OH-100:10:1).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 8.50 (m, 1H), 8.22 (d, 1H), 7.78 (m, 3H), 7.15-7.60 (m, 11 H), 5.52 (s, 2H), 3.75 (t, 4H), 3.60(s, 2H), 3.0 (m, 2H), 2.52 (t, 4H), 1.84 (t, 2H), 1.44 (s, 9H), 1.1-1.4 (m, 6H).

FAB-MS: (m/e) 780 (M+H).

5      Step 3:    4-(Morpholinomethyl)phenyl-2-[(2'-(6-aminohexanoyl)-aminosulfonyl)-biphen-4-yl]methyl-phthalazin-1-(2H)-one.  
        4-(Morpholinomethyl)phenyl-2-[(2'-(6-(N-t-butyloxy-carbonylamino)hexanoyl)aminosulfonyl)-biphen-4-yl]-methyl-phthalazin-1-(2H)-one, obtained in step 2, (0.10 g) was dissolved in a mixture of methylene chloride (1 mL) and anhydrous trifluoroacetic acid (1 mL). The mixture was stirred at room temperature for 1h then concentrated in vacuo to dryness. Dry ether was added and the solid obtained was filtered and dried to give the titled compound as the ditrifluoroacetic acid salt (0.08 g).

10     1H-NMR (CD<sub>3</sub>OD): δ 8.50 (m, 1H), 8.22 (d, 1H), 7.78 (m, 3H), 7.15-7.60 (m, 11 H), 5.52 (s, 2H), 3.75 (t, 4H), 3.60(s, 2H), 3.0 (m, 2H), 2.52 (t, 4H), 1.84 (t, 2H), 1.2-1.4 (m, 6H).

#### EXAMPLE 49

Typical Pharmaceutical Compositions Containing a Compound of the Invention [e.g. 4-p-tolyl-2-(2'-(5-(N,N-dimethyl-carboxamido)-pentanoyl)aminosulfonyl)biphen-4-yl)methyl-phthalazin-1-(2H)-one (Example 26)].

A:	Dry Filled Capsules Containing 50 mg of Active Ingredient <u>Per Capsule</u>
<u>Ingredient</u>	<u>Amount per capsule (mg)</u>
30    Title compound of Example 26	50
Lactose	149
Magnesium stearate	<u>1</u>
Capsule (size No. 1)	200

- 51 -

The title compound of Example 26 can be reduced to a No. 60 powder and the lactose and magnesium stearate can then be passed through a No. 60 blotting cloth onto the powder. The combined ingredients can then be mixed for about 10 minutes and filled into a No. 5 dry gelatin capsule.

**B: Tablet**

A typical tablet would contain the title compound of Example 26 (25 mg), pregelatinized starch USP (82 mg), 10 microcrystalline cellulose (82 mg) and magnesium stearate (1 mg).

**C: Suppository**

Typical suppository formulations for rectal administration can contain the title compound of Example 26 (1-25 mg), butylated hydroxyanisole (0.08-1.0 mg), disodium calcium edetate (0.25-0.5 mg), and polyethylene glycol (775-1600 mg). Other suppository formulations can be made by substituting, for example, butylated hydroxytoluene (0.04-0.08 mg) for the disodium calcium edetate and a hydrogenated vegetable oil (675-1400 mg) such as Suppocire L, 20 Wecobee FS, Wecobee M, Witepsols, and the like, for the polyethylene glycol.

**D: Injection**

A typical injectable formulation would contain the title compound of Example 26 (5.42 mg), sodium phosphate dibasic anhydrous (11.4 mg) benzyl alcohol (0.01 ml) and water for injection (1.0 ml).

5           7. A method of treating a condition in a mammal, the treatment of which is effected or facilitated by a decrease in neurotensin mediated actions, comprising the administration of a compound of structural formula I as recited in Claim 1, in an amount that is effective for antagonizing the effect of neurotensin.

10

8. The method of claim 7, wherein the condition is selected from the group consisting of : psychoses, depression, Alzheimer's disease, anxiety, gastroesophageal reflux disorder (GERD), irritable bowel syndrome, diarrhea, cholic, ulcer, GI tumor, dyspepsia, 15 pancreatitis or esophagitis.

9. The method of claim 8, wherein the condition is psychoses.

20

10. The method of treating a condition through neurotensin receptor blockade by administering to a mammal in need of such treatment a therapeutically effective amount of a compound of structural formula I as defined in claim 1.

- Special categories of cited documents:
- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "A" document defining the general state of the art which is not considered to be part of particular relevance
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "E" earlier document published on or after the international filing date
- "L" document which may throw doubt on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "R" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed
